## Introduction

- Goal
  - Simultaneously localize (with boxes) objects of the same class across a set of distinct images

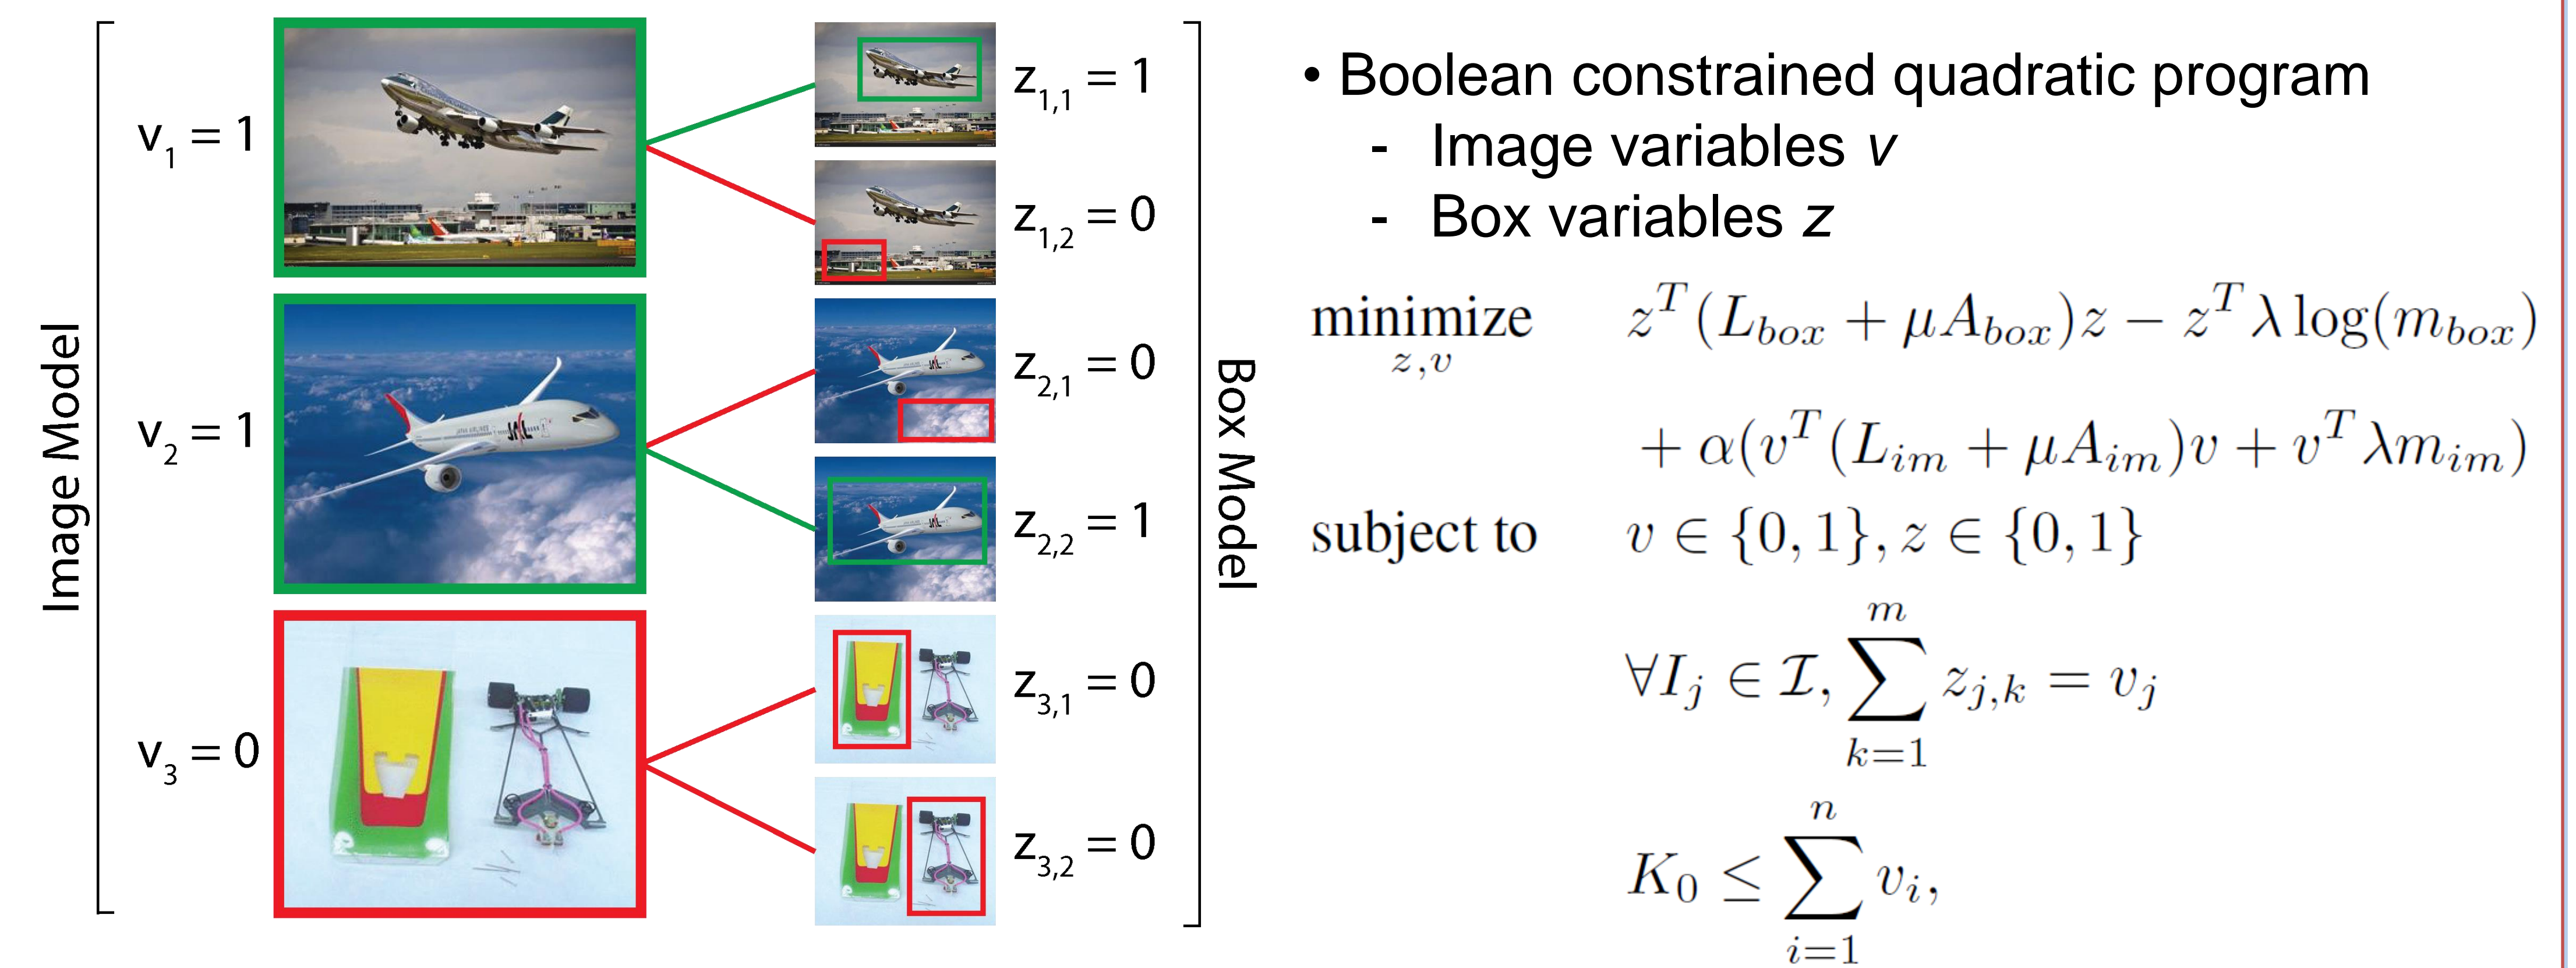

- Real-World Images
  - Intra-class variation of objects
  - Inter-class diversity of objects
  - Annotation noise in image tags/labels

## Our Approach

## Joint Image-Box Model

- **Prior** (linear term):  $m$  vector
  - Image prior: chi-squared distance to average image feature in set
  - Box prior: average saliency weighted by size of box
- **Similarity** (quadratic term):  $L$  matrix
  - Encourage images/boxes with similar appearances to have the same label
  - Normalized Laplacian matrix computed from chi-squared similarity matrix
- **Discriminability** (quadratic term):  $A$  matrix
  - Encourage selecting images/boxes that are discriminatively separable from others
  - Closed-form solution to ridge regression objective function

## PASCAL VOC 2007

Method	Average CorLoc
Russell et al. [25]	22
Chum and Zisserman [7]	33
Deselaers et al. [9]	37
Our Method (prior)	13
Our Method (prior+similarity)	31
Our Method (full)	39

- PASCAL07-6x2 subset [9]
  - aeroplane, bicycle, boat, bus, horse, motorbike
  - 12 class/viewpoint combinations, 463 images total

## ImageNet

- Co-localize all images with ground-truth bounding box annotations
- 3,624 classes / 939,542 images

Method	Average CorLoc
Top objectness box [1]	37.42
Our Method	53.20

## Object Discovery Dataset

- 100 image subset [24]
  - airplane, car, horse
  - Noisy images that may not contain object

Method	Average CorLoc
Kim et al. [17]	12.69
Joulin et al. [15]	51.35
Joulin et al. [16]	58.02
Rubinstein et al. [24]	75.16
Our Method	76.58

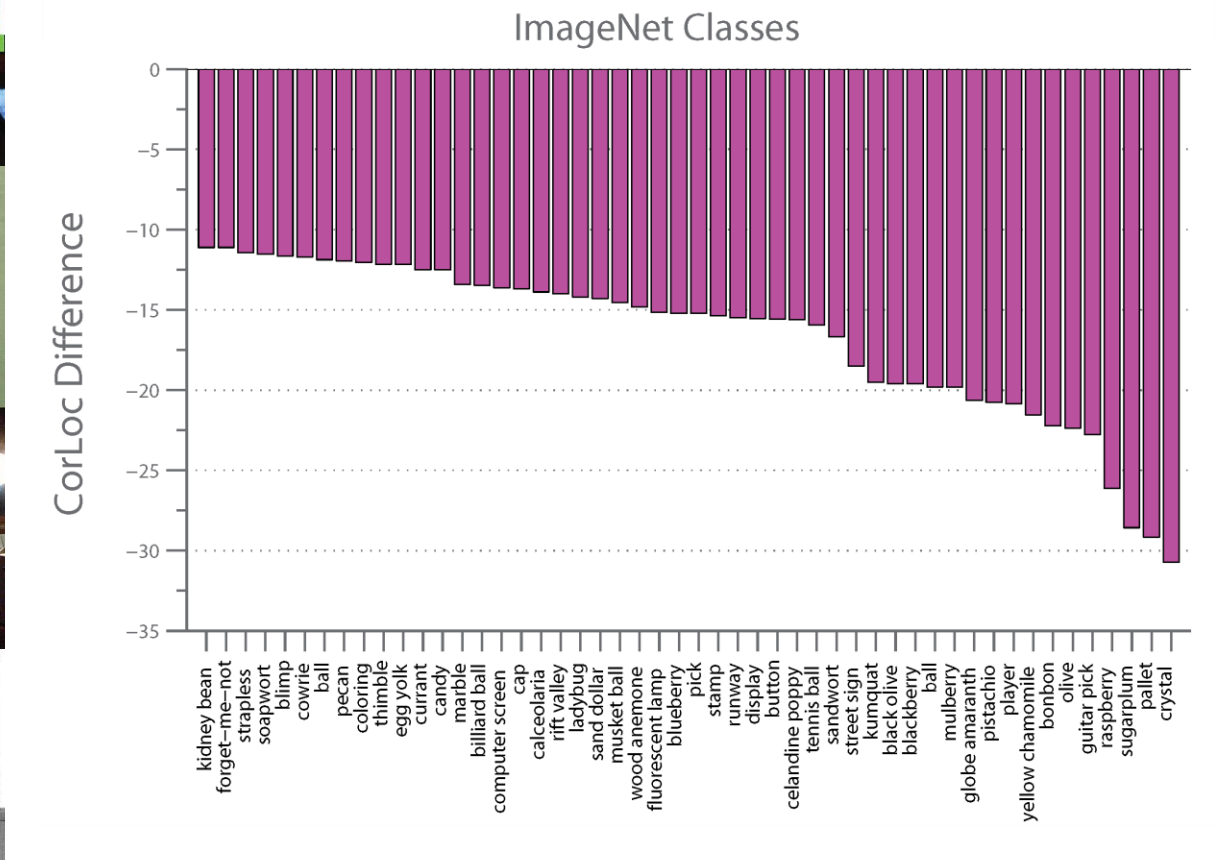

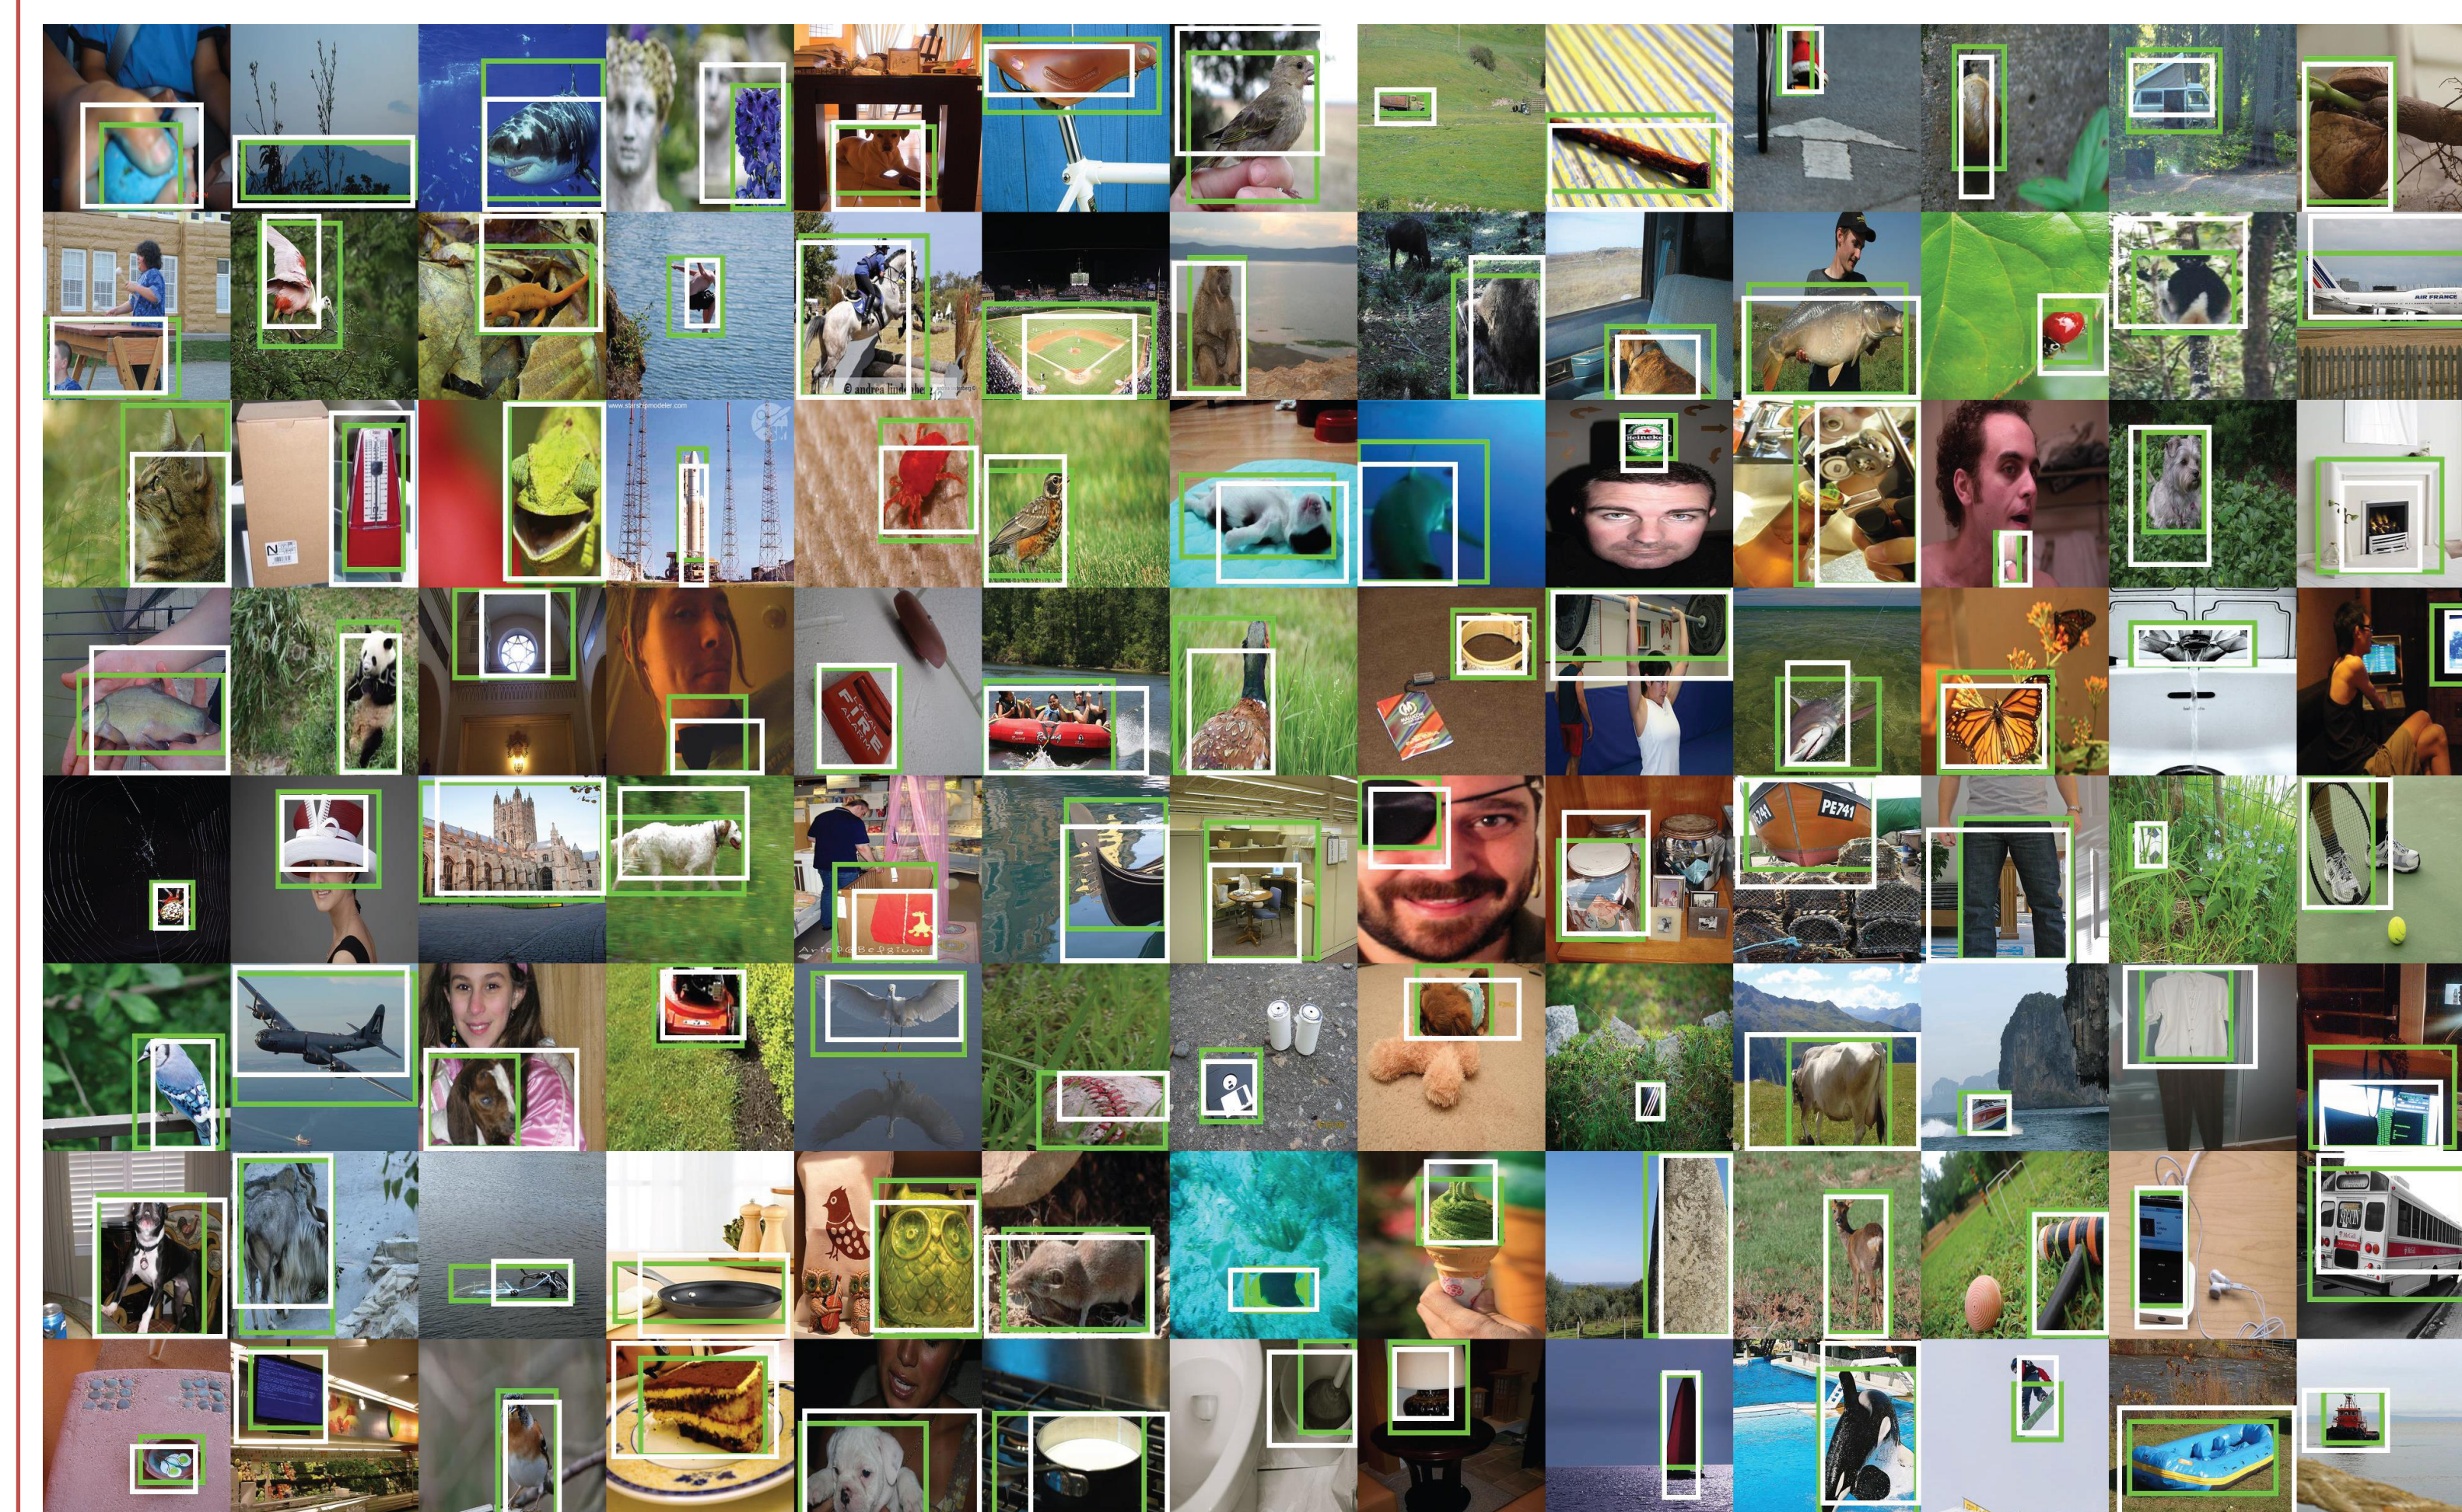

- CorLoc measurement [9]
  - Percentage of images correctly localized according to PASCAL criterion

Precision-recall curves for identifying noisy images

Example results: our method (white), ground-truth (green)

Distribution of best/worst CorLoc differences
